

"It is way out in front"

(Security Test, 1992)

The King of the Castles.

The Castle 2700 Diagnostic Control Panel.

At last an alarm control panel that allows a security system to look after itself.

- * The Castle Care-Tech 2700 is King of a new generation of control panels that provide continuous analysis of the major component parts and wiring of a system to assure its trouble-free and effective operation.
- * For the engineer life will be made simpler and more efficient by using the Castle Care-Tech 'Double Check' test and diagnostic routine to confirm that the whole system is correctly installed and operating effectively.
- * Problems can be put right before they become a problem. The 'Double Check' routine analyses the major component parts of the alarm system and

wiring every minute of every day for signs of deterioration or developing problems.

- * Installation Managers can have greater confidence at the commissioning and maintenance visits knowing that the engineer's work is being 'Double Checked' and that a full printed report can be attained to confirm that the job has been correctly done.
- * The 2700 is a 32 zone panel comprising a blank box end station and a master key pad. In addition it accepts up to 4 slave keypads. The panel offers 4 independent areas of set along with full set with total flexibility for assigning zones. The keypads are available with either **tactile** or **membrane** keys.

It can truly be said that the 2700 is 'King of the Castles'.
